# PC Safety KPI Roadmap 7 Recommendations

Roadmap for the Development of  
the Safety Key Performance Indicators in ATM

2ND SAFREPTF Report  
to the Provisional Council

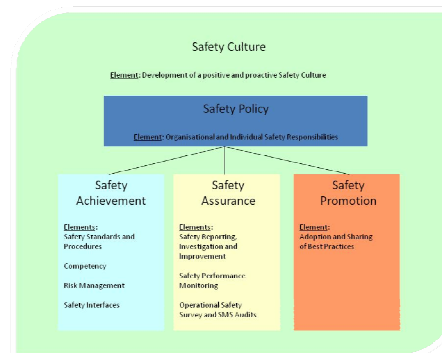

1. Strengthen the ESARR 2 AST
2. Continuation of Safety Maturity beyond ESP lifetime and usage of ESIMs to derive REG KPIs
3. States to ensure adequate resources to populate AST
4. Cautious approach in adopting targets
5. **by November 2009 SAFREP TF produce a range of key indices, which would measure the state or “health” of the ATM safety system. ...make best use of existing practices, data flows, rules and regulations with the scope of minimising new approaches ...to observe the roadmap described in Chapter 4 of the Roadmap Report**
6. **wide consultation with all interested stakeholders before any adoption**
7. **PC to agree on the Roadmap and stakeholders to provide adequate resources to ensure the development of Safety KPIs by 2009**

- **What is in the package**
  - **New Safety Maturity for ANSPs**
  - **New Safety Maturity for REGs**
  - **New Severity and Risk assessment Mark Sheets – RAT**
  - **New packaging for Lagging Indicators – APF**

# 2010+ ANSPs ATM Safety Framework Study Areas (in partnership with CANSO)

ATM Safety Framework  
Maturity Survey  
Methodology for ANSPs

Area No.	ANSP Study Areas
<b>Safety Culture</b>	
SA1	Development of a positive and proactive safety culture
<b>Safety Policy</b>	
SA2	Organisational and Individual Safety Responsibilities
SA3	Timely Compliance with International Obligations
<b>Safety Achievement</b>	
SA4	Safety standards and procedures
SA5	Competency
SA6	Risk Management
SA7	Safety Interfaces
<b>Safety Assurance</b>	
SA8	Safety Reporting, Investigation and Improvement
SA9	Safety Performance Monitoring
SA10	Operational Safety Surveys and SMS Audits
<b>Safety Promotion</b>	
SA11	Adoption and Sharing of Best Practices

## New maturity Level Flow

State ATM Regulators & ANSPs are asked to assess their ATM Safety Framework Maturity in the following categories:

Adapted from CMMI model recognised by Industry.

# Severity and Risk assessment of ATM Safety Occurrences – the RAT !

## Harmonisation of Safety Occurrence Severity and Risk of Recurrence Assessment

Guidance Material

- RAT is a post-investigation Tool
- RAT (Excel sheet) works as follows:
  - Requires the user to answer questions looking as much as possible at the facts
  - Based on these answers RAT computes proposed Risk classifications for ATC, as well as for the Overall ATM/NAS (i.e. ATC plus pilot)
- Adopted as of 1<sup>st</sup> of Oct by FAA

- Assessing performance means assessing the impact of many different factors and events into a cohesive measurement tool.
- Always require to combine tangible and intangible elements to determine their *influence* on the overall system.
  - Because humans are involved, “safety”, “efficiency” and “effectiveness” can become intangible due to different experience and perspectives.

# The Analytic Hierarchy Process (AHP)

- AHP is a structured technique for making complex decisions, based upon psychological and mathematical principles
- Developed in the 1970s
- AHP decomposes decision problem into a hierarchy of more easily comprehended sub-problems (criteria)
- Criteria can relate to *any* aspect of the problem – tangible or intangible
- Once hierarchy is built options are systematically evaluated and combined to produce 'local' and 'global' ranking of elements
- Evaluation by pairwise comparison
  - e.g. option A vs option B, option A vs option C, etc ...

- Uses expert judgment to prioritise these criteria, i.e. give weights
- Example: rank a pool of cars based on a combination of criteria such as cost, safety, style, capacity
  - Each car evaluated separately
  - Importance of each criteria also weighed
  - Then each car evaluated based on those weights

# The Analytic Hierarchy Process – an example

GOAL

Choose the best car for the Jones family

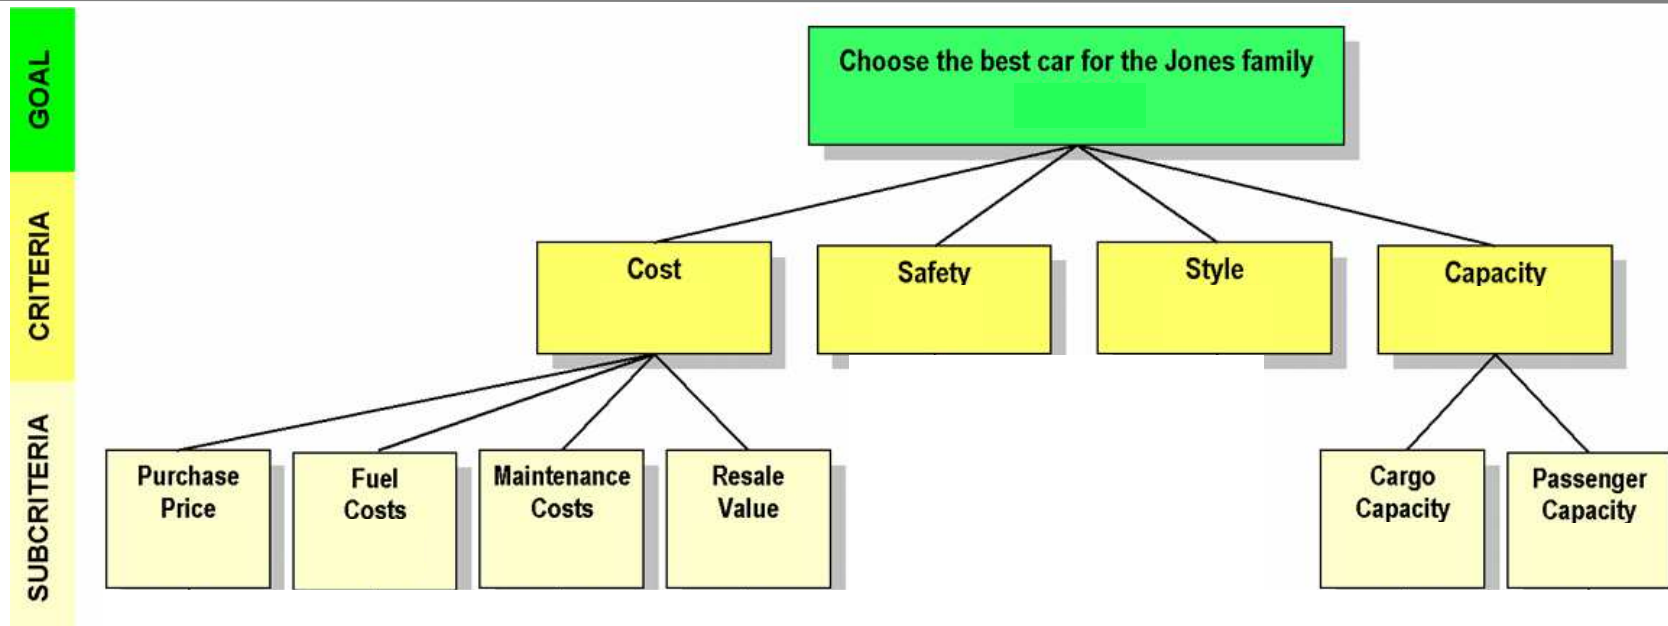

# The Analytic Hierarchy Process – an example

GOAL

CRITERIA

# The Analytic Hierarchy Process – an example

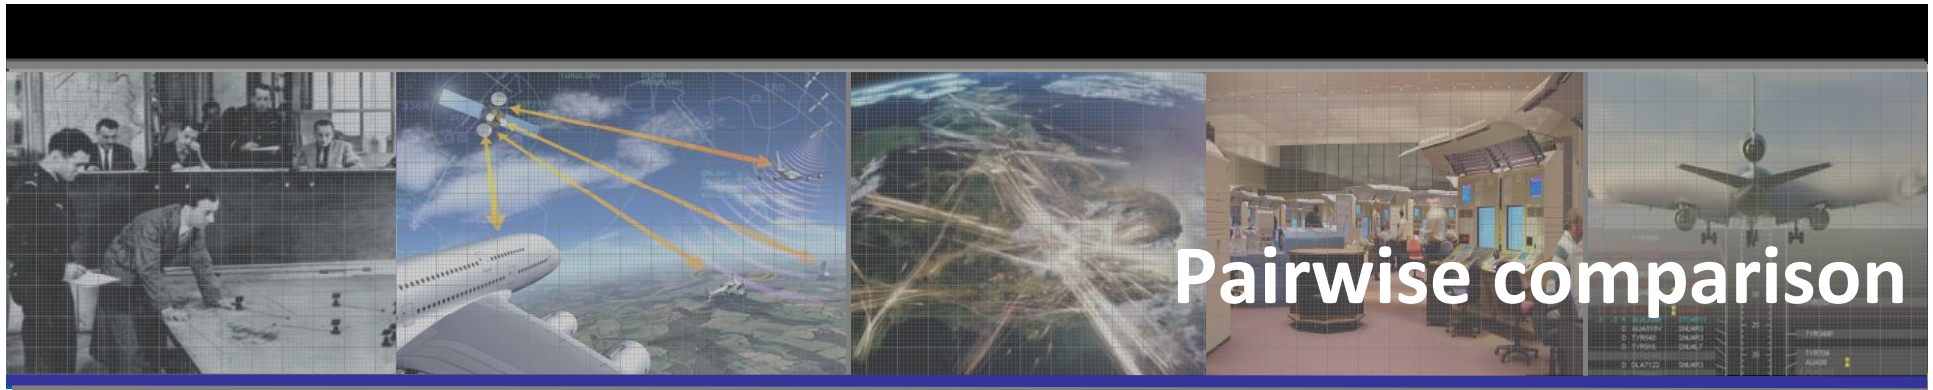

## Weighting of criteria

- All criteria are equal, but some are more equal than others
- Therefore, criteria must be allocated weights
- Easiest way to do it: pairwise comparison
  - Between criterion A and criterion B, which one is more important?
  - By how much?
- The result: each criterion gets a weight between 0 and 1
- All weights add up to 1

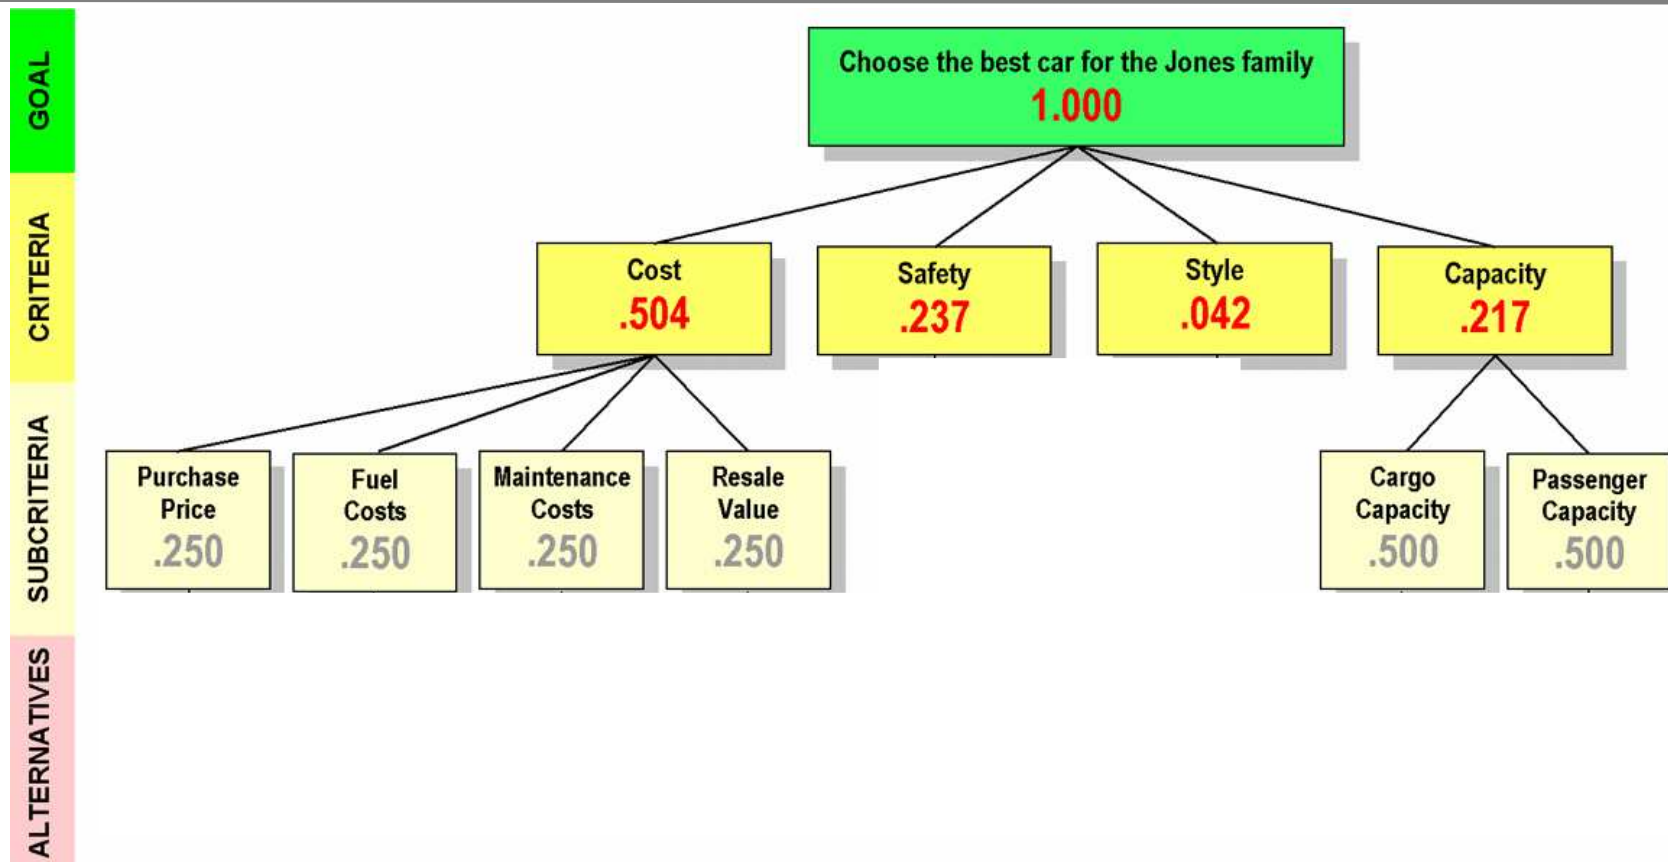

- Very important: Subject Matter Experts
- Well prepared, good definitions, well explained
- Consistent weighting

## Runway Incursion

## All Ground Incidents which are not Runway Incursion

Tom

Dick

Harry

Goal:

Choose a Leader  
1.000

Criteria:

Age  
.300

Experience  
.400

Education  
.100

Charisma  
.200

Alternatives:

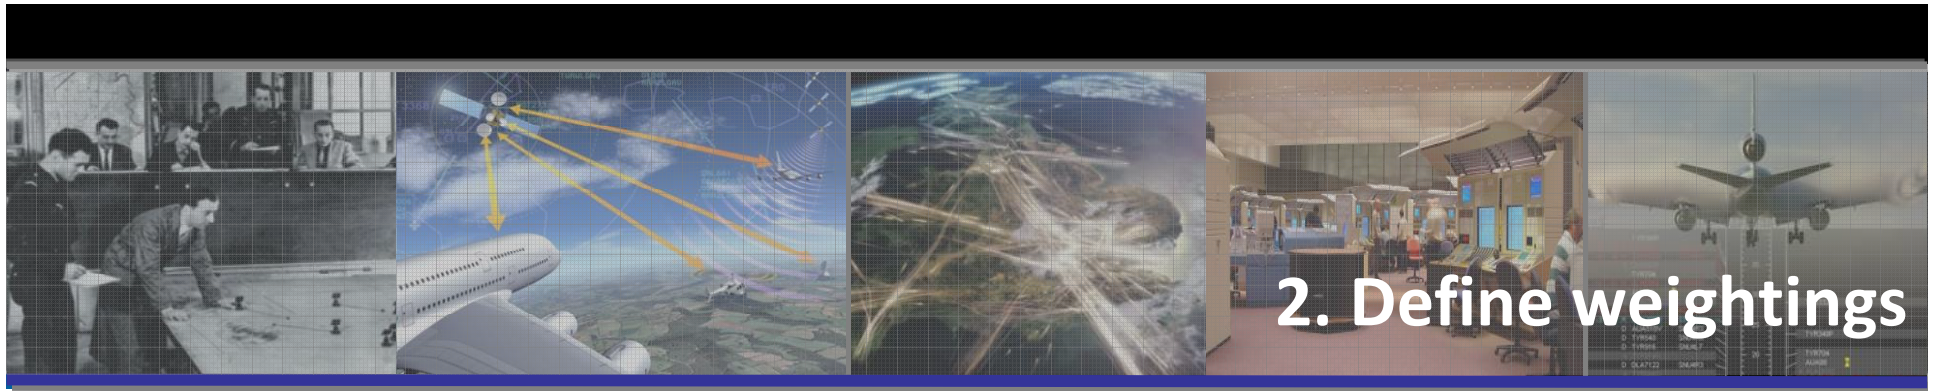

Tom  
.325

Dick  
.450

Harry  
.225

## 2. Define weightings

### 3. Define metrics

		(age ranges: >20-<35=value 1, 35-<45=value 2, 45-<55=value 3, 55 and >=value 4)	
Age	enter value		
TOM	3		54
DICK	4		57
HARRY	2		36
Experience	enter value	(number of years in field 1 (X2)+ number of years in field 2 (X3)):100	
TOM	7,4	22x2=44, 10x3=30	
DICK	7,5	30x2=60, 5x3=15	
HARRY	3,6	12x2=24, 7x3=21	
Education	enter value	(secondary education diploma (1) + university degree (2)+ PhD (5))	
TOM	3	Secondary plus university degree	
DICK	1	Secondary	
HARRY	5	secondary plus university degree plus Phd	
Charisma	enter value	(subjective mark allocated during interview-range 1 to 5)	
TOM	4		
DICK	2		
HARRY	4

# AHP applications

## Described applications below

- use a “hybrid” or “simplified” version of AHP techniques to gather expert opinions for weighting.
- Are not used as a multi criterion decision tool but pair-wise comparison process determines the weights
- Can finally merge “apples’ and “oranges”
- “Between these two elements, which one has more influence on the organizations goal?”

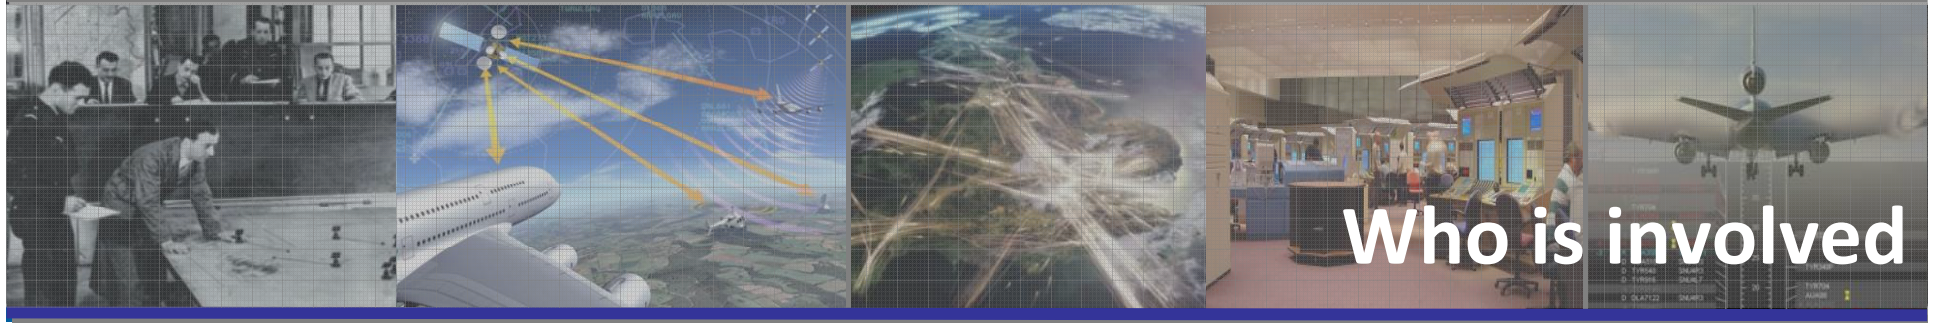

# AHP application

## Aerospace Performance Factor (APF)

- The APF presents a graphical view of performance.
  - based on *historical indicators (lagging) from multiple databases.*
- Allows organization to have a *macro-system-wide view of performance.*
  - then “drill down” into data to search for causal factors.
- Tracks organizational performance over time.
  - using safety, operational, and/or equipment metrics.
- Does not focus on a single metric to measure performance.
- Incorporates organizational judgment and experience of factors.
  - Measures intangibles
- Allows for analysis and search for precursors.
- Can function as a model for decision making & is expandable in size and scope.

- **FAA**

- Imperial College, London
- easyJet Airlines
- U. S. Navy's Aviation Safety Center
- Albuquerque New Mexico and Denver Colorado Air Route Traffic Control Centers (ACCs)
- Southwest Airlines

- **EUROCONTROL &**

- Ireland (IAA)
- UK (NATS)
- Germany (DFS)
- France (DSNA)
- Poland (PANSA)
- Netherlands (LVNL)
- Hungary
- FABs

# One Concept: Incidents & Trends

• *One concept of safety....*

- The worst event in aviation is an accident.
  - The system has multiple checks and balances, “threads of safety” that help prevent accidents.
  - Everything that is not an accident is an incident.
  - Incidents represent “breaks” in the “threads of safety” and may represent gross precursors of safety.
- **Air Traffic Incidents**
    - Operational Errors (OE)
    - Operational Deviations (OD)
    - Near Mid-Air Collisions (NMAC)
    - Pilot Deviations (PD)
    - Runway Incursions (RI)
    - Vehicle or Pedestrian Deviations (VPD)

# “Historical” Presentation Format

				2000		2004		Difference
<b>Aircraft Accidents</b>								
	<b>Air Carrier</b>			56		29		-27
	<b>Air Taxi/Commuter</b>			92		73		-19
	<b>GA</b>			1835		1614		-221
<b>NMAC</b>				237		145		-92
<b>PDs</b>				1919		2628		709
<b>OE</b>				1139		1216		77
<b>VPD</b>				547		263		-284
<b>Surface Incidents</b>				1396		882		-514
<b>Runway incursions</b>				426		310		-116
<b>Aircraft Operations</b>								
				46,056,000		46,762,000		706,000
	<b>Air Carrier</b>			25,080,000		24,278,000		-802,000
	<b>Air Taxi/Commuter</b>			8,164,000		10,029,000		1,865,000
	<b>GA</b>			8,634,000		8,374,000		-260,000
	<b>Military</b>			4,178,000		4,071,000		-107,000
<b>Aircraft Hours</b>				318,000,000		273,000,000		-45,000,000

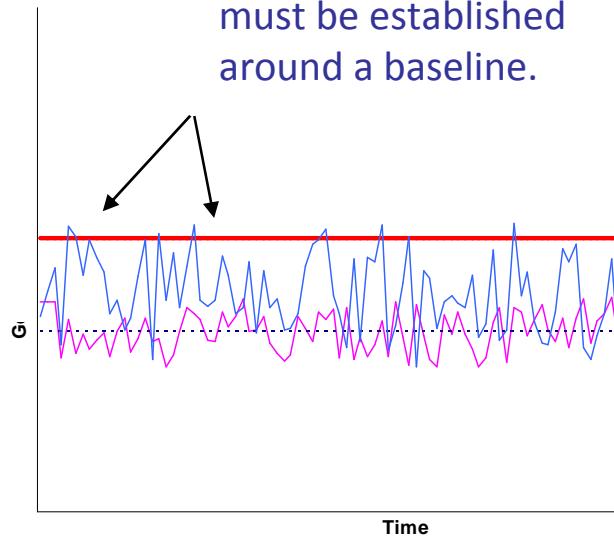

Can We Really Measure Total Organizational Change?

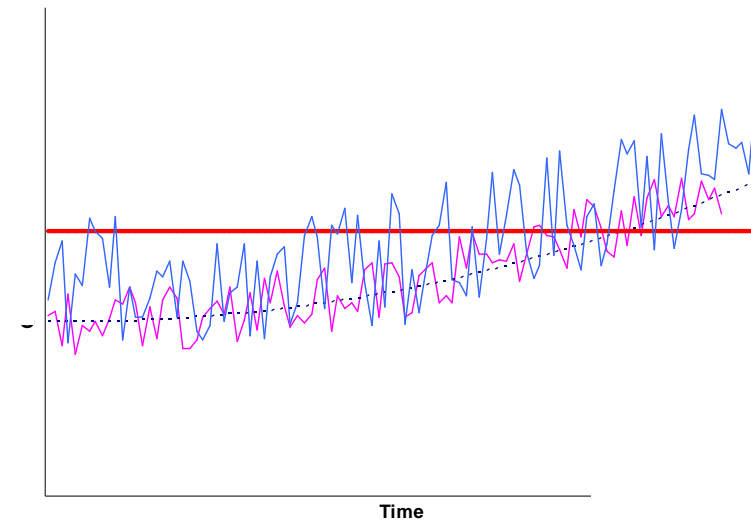

# Concepts: Time, Performance Parameters, Baselines, and Trends

Organizations can fluctuate. An acceptable parameter must be established around a baseline.

Trends assist in seeing gradual changes. Drill down into the trend data focuses on specific problem areas.

***Avoids the “Boil the Frog” Syndrome***

# Weights

## The Role of Weighting Factors, Time, and Operations: “Risk Exposure” & Expert Judgment

- **The Denominator~ The Positive Side**
- **Weighting of Factors~**
  - Allows the organization to incorporate quantitative value of expertise and judgment.
  - “Importance” or “influence” or “risk” associated with a data element as perceived by the organizations experts
- **Term “risk” is normally associated with the future. The APF uses lagging indicators from the past to establish a trend line whereby future changes may be inferred.**

# Other AHP application

## easyJet Flight Operations Mindmap-Complexity Increasing

# Other AHP application EUROCONTROL MINDMAP (abbreviated version)

# International Harmonization: Leveraging Experience to Work Toward Risk Modeling

- **EUROCONTROL**
  - Multiple ANSPs involved.
  - 2009 Work Project of EUROCONTROL
  - Using ESSAR 2 measures (safety)
  - Proposed for European deployment as of 2010 within ESP+ Programme
- **easyJet Airlines**
  - 2<sup>nd</sup> largest LCC airline in Europe
  - Focused on flight operations measures
  - FDM, FOQA, and other data feeding metric
- **Southwest Airlines**
  - Most successful LCC in the world
  - Started the process of defining their APF

## Conclusions & Caveats

- The APF is not a stand alone tool
  - Current measurements must be maintained.
- The APF identifies “what” is happening, “where”, and “when” thru both trending and diagnostics:
  - As additional metrics, with greater granularity, are introduced into the APF, it will enable the quest for “why.”
- The APF *is not* a direct indication of risk.
  - But does reflect the organizations assessment of relative risk within the operation.
- The APF can be used to measure efficiency & effectiveness depending on what measures are used.
